Modbus/TCP Communications
Instruction Manual

POWER ANALYZER

EN

Oct. 2024 Revised edition 1
PW8001A968-01

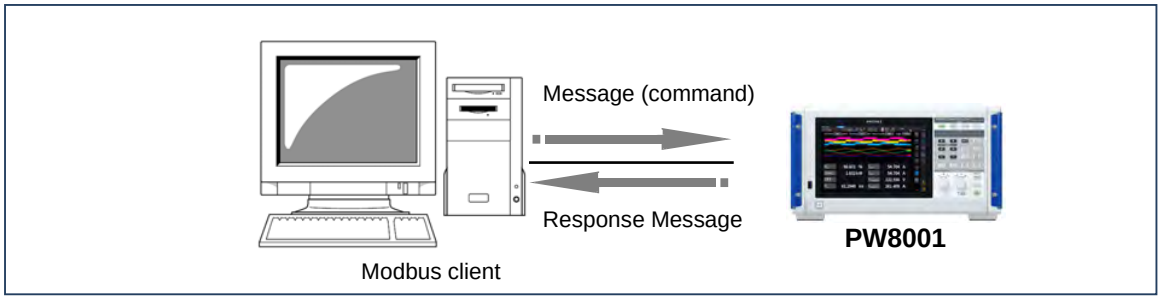
- ✓ This instruction manual explains only the Modbus/TCP communication.
- ✓ Before using PW8001, be sure to read the instruction manual of PW8001.
- ✓ For details regarding the PW8001 communication settings, please refer to “9 Connecting the Instrument to a PC” in the PW8001 Instruction Manual.
- ✓ Although all reasonable care has been taken in the production of this instruction manual, should you find any points which are unclear or in error, please contact your local distributor or the HIOKI International Sales Department.

Contents

1 Modbus/TCP Communication

1.1 Function Overview

In this manual, PW8001 is represented as the instrument.
This instrument functions as a Modbus/TCP server. You can control the instrument and acquire measurement data by sending messages from a Modbus client instrument to this instrument.



The instrument uses **TCP/IP port 502** as a listening port for the Modbus/TCP communication.
In addition, **the unit ID (server address)** for the Modbus/TCP server of this instrument is **1**. Any messages with a unit ID other than this value cannot be accepted.

1.2 Function Code

The function codes supported by the instrument are as follows.

Code No.	Functions	Description
0x03	Reading the holding register	Reads up to 125 sets of data continuously from the holding register.
0x04	Reading the input register	Reads up to 125 sets of data continuously from the input register.
0x06	Writing to the holding register	Writes data to one holding register.

1.3 Specifying a Register

You can specify a register from the Modbus client instrument as follows.

1.3.1 When using a commercially available SCADA system, etc.

Specify the Ref No. (reference number) listed in “3.1 Register Map” and “4.1 Register Map”.
Example: Specify Ref No. “30021” to acquire Urms1 Float lower 2 bytes “Input register:0020”.

1.3.2 When using a communication program created by the customer

Specify the Hex No. (relative number) listed in 3.1 Register Map” or “4.1 Register Map”.
Example: Specify Hex No. “0014” to acquire Urms1 Float lower 2 bytes “Input register:0020”.

2 Register

2.1 Register Overview

In this instrument, measurement data and settings data are assigned to the internal register for Modbus/TCP.

When the client instrument sends messages to the instrument via Modbus/TCP communication and the internal register of the instrument is read and written, measurement data can be acquired, integration can be started, etc.

2.2 Register Configuration (Overall Configuration)

	Register No.	Category		Description
Input register	0000 to 0019	Status		Status of each channel
	0020 to 0845	Basic measurement items	Power measurement items	Measurement data, such as voltage, current, and power
	1000 to 1205		Integration measurement items	Data regarding integration measurement
	2000 to 2087		Frequency and calculation measurement items	Frequency measurement data and user-defined formula (UDF) data
	3000 to 3047		Motor analysis measurement items	Motor analysis measurement data
	3500 to 3643		Flicker measurement items	IEC Flicker measurement data
	4000 to 4239	Harmonic measurement items		Harmonic measurement data
	4500 to 4563	Inter-harmonic measurement items		Inter-harmonic measurement data
	5000 to 5247	CUSTOM screen items		Measurement data linked to the CUSTOM screen display
	6000 to 7999	Optional output items		Measurement data specified using communication commands
	8000 to 8039	Measurement range setting items		Measurement range information
	10000 to 10019	[Secondary instrument] Status		Status of each channel
	10020 to 10845	[Secondary instrument] Basic measurement items	Power measurement items	Measurement data, such as voltage, current, and power
	11000 to 11205		Integration measurement items	Data regarding integration measurement
	12000 to 12087		Frequency and calculation	Frequency measurement data and user-defined formula

			measurement items	(UDF) data
	13000 to 13047		Motor analysis measurement items	Motor analysis measurement data
	14000 to 14239	[Secondary instrument] Harmonic measurement items		Harmonic measurement data
	18000 to 18039	[Secondary instrument] Measurement range setting items		Measurement range information
Holding register	0000 to 0007	Instrument control		Register value hold, integration control, etc.
Others		Prohibited area		Reading and writing are not supported.

Note
[Secondary instrument] is valid only when synchronous measurements are made using the optical link interface.
The register number is the primary device's register number plus 10000.

2.2.1 Input register non-assigned area

Any area with input register numbers skipped (register No. 0846 to 999, etc.) is an area to which data is not assigned. This area can be read with a Modbus message; however, the value is all NAN (0x7FC00000). Access to the address beyond the suffix of the input register (register No. 8040) generates an error.

3 Input Register

3.1 Register Map

3.1.1 Status

Reg No.	Ref No.	Hex No.	Register name	Register description	
0000	30001	0000	Status	Status	uint32 lower 2 bytes
0001	30002	0001			uint32 upper 2 bytes
0002	30003	0002	StatusCH1	CH1 status	uint32 lower 2 bytes
0003	30004	0003			uint32 upper 2 bytes
0004	30005	0004	StatusCH2	CH2 status	uint32 lower 2 bytes
0005	30006	0005			uint32 upper 2 bytes
0006	30007	0006	StatusCH3	CH3 status	uint32 lower 2 bytes
0007	30008	0007			uint32 upper 2 bytes
0008	30009	0008	StatusCH4	CH4 status	uint32 lower 2 bytes
0009	30010	0009			uint32 upper 2 bytes
0010	30011	000A	StatusCH5	CH5 status	uint32 lower 2 bytes
0011	30012	000B			uint32 upper 2 bytes
0012	30013	000C	StatusCH6	CH6 status	uint32 lower 2 bytes
0013	30014	000D			uint32 upper 2 bytes
0014	30015	000E	StatusCH7	CH7 status	uint32 lower 2 bytes
0015	30016	000F			uint32 upper 2 bytes
0016	30017	0010	StatusCH8	CH8 status	uint32 lower 2 bytes
0017	30018	0011			uint32 upper 2 bytes
0018	30019	0012	StatusMotor	Motor channel status	uint32 lower 2 bytes
0019	30020	0013			uint32 upper 2 bytes

3.1.2 Power measurement items

Reg No.	Ref No.	Hex No.	Register name	Register description	
0020	30021	0014	Urms1	CH1 voltage RMS value	Float lower 2 bytes
0021	30022	0015			Float upper 2 bytes
0022	30023	0016	Urms2	CH2 voltage RMS value	Float lower 2 bytes

5014	35015	1396	8Item8	Measurement data	Float lower 2 bytes
5015	35016	1397		assigned to 8Item8	Float upper 2 bytes
5016	35017	1398	16Item1	Measurement data	Float lower 2 bytes
5017	35018	1399		assigned to 16Item1	Float upper 2 bytes
:	:	:			
5046	35047	13B6	16Item16	Measurement data	Float lower 2 bytes
5047	35048	13B7		assigned to 16Item16	Float upper 2 bytes
5048	35049	13B8	36Item1	Measurement data	Float lower 2 bytes
5049	35050	13B9		assigned to 36Item1	Float upper 2 bytes
:	:	:			
5118	35119	13FE	36Item36	Measurement data	Float lower 2 bytes
5119	35120	13FF		assigned to 36Item36	Float upper 2 bytes
5120	35121	1400	64Item1	Measurement data	Float lower 2 bytes
5121	35122	1401		assigned to 64Item1	Float upper 2 bytes
:	:	:			
5246	35247	147E	64Item64	Measurement data	Float lower 2 bytes
5247	35248	147F		assigned to 64Item64	Float upper 2 bytes

3.1.10 Optional output items

Output items specified using the communications command :MODBus:ITEM <Output No.>,<Output item>

Reg No.	Ref No.	Hex No.	Register name	Register description	
6000	36001	1770	Item1	Output items with	Float lower 2 bytes
6001	36002	1771		<Output No.>=1	Float upper 2 bytes
6002	36003	1772	Item2	Output items with	Float lower 2 bytes
6003	36004	1773		<Output No.>=2	Float upper 2 bytes
:	:	:			
Reg No.:6000+(X−1)×2			ItemX	Output items with	Float lower 2 bytes
Reg No.:6000+(X−1)×2+1				<Output No.>=X	Float upper 2 bytes
:	:	:			
7996	37997	1F3C	Item999	Output items with	Float lower 2 bytes
7997	37998	1F3D		<Output No.>=999	Float upper 2 bytes
7998	37999	1F3E	Item1000	Output items with	Float lower 2 bytes
7999	3800	1F3F		<Output No.>=1000	Float upper 2 bytes

3.1.11 Measurement range setting items

Reg No.	Ref No.	Hex No.	Register name	Register description	
8000	38001	1F40	URange1	CH1 voltage range value	Float lower 2 bytes
8001	38002	1F41			Float upper 2 bytes
8002	38003	1F42	URange2	CH2 voltage range value	Float lower 2 bytes
8003	38004	1F43			Float upper 2 bytes
8004	38005	1F44	URange3	CH3 voltage range value	Float lower 2 bytes
8005	38006	1F45			Float upper 2 bytes
8006	38007	1F46	URange4	CH4 voltage range value	Float lower 2 bytes
8007	38008	1F47			Float upper 2 bytes
8008	38009	1F48	URange5	CH5 voltage range value	Float lower 2 bytes
8009	38010	1F49			Float upper 2 bytes
8010	38011	1F4A	URange6	CH6 voltage range value	Float lower 2 bytes
8011	38012	1F4B			Float upper 2 bytes
8012	38013	1F4C	URange7	CH7 voltage range value	Float lower 2 bytes
8013	38014	1F4D			Float upper 2 bytes
8014	38015	1F4E	URange8	CH8 voltage range value	Float lower 2 bytes
8015	38016	1F4F			Float upper 2 bytes
8016	38017	1F50	IRange1	CH1 current range value	Float lower 2 bytes
8017	38018	1F51			Float upper 2 bytes
8018	38019	1F52	IRange2	CH2 current range value	Float lower 2 bytes
8019	38020	1F53			Float upper 2 bytes
8020	38021	1F54	IRange3	CH3 current range value	Float lower 2 bytes
8021	38022	1F55			Float upper 2 bytes
8022	38023	1F56	IRange4	CH4 current range value	Float lower 2 bytes
8023	38024	1F57			Float upper 2 bytes
8024	38025	1F58	IRange5	CH5 current range value	Float lower 2 bytes
8025	38026	1F59			Float upper 2 bytes
8026	38027	1F5A	IRange6	CH6 current range value	Float lower 2 bytes
8027	38028	1F5B			Float upper 2 bytes
8028	38029	1F5C	IRange7	CH7 current range value	Float lower 2 bytes
8029	38030	1F5D			Float upper 2 bytes
8030	38031	1F5E	IRange8	CH8 current range value	Float lower 2 bytes
8031	38032	1F5F			Float upper 2 bytes
8032	38033	1F60	URangeA	CHA voltage range	Float lower 2 bytes
8033	38034	1F61			Float upper 2 bytes
8034	38035	1F62	URangeC	CHC voltage range	Float lower 2 bytes
8035	38036	1F63			Float upper 2 bytes
8036	38037	1F64	URangeE	CHE voltage range	Float lower 2 bytes
8037	38038	1F65			Float upper 2 bytes
8038	38039	1F66	URangeG	CHG voltage range	Float lower 2 bytes
8039	38040	1F67			Float upper 2 bytes

3.2 Float Format Data

Float is IEEE754 single-precision floating-point format (32-bit) data.

One Modbus register is fixed to 16 bits and the Float format data is divided and saved to two registers with 16 bits each.

As all Float format data for this instrument is arranged in Little Endian order (in order of lower 16 bits and upper 16 bits), specify “Little” for the data order in which Float format data is handled on the client side.

Example: When CH1 voltage RMS value Urms1 is 100 V, the reading of the register is as follows.

Input register: 0020 = “0x0000”

Input register: 0021 = “0x42C8”

Data when an error occurs is as follows.

Exceeded value	+99999.9E+30
Error value	+77777.7E+30
Unassigned register Example: 0846 to 999	0x7FC00000 (NAN)

3.3 Harmonic Measurement Items

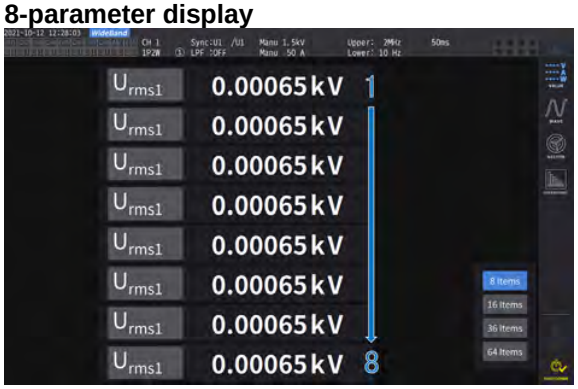
The harmonic measurement items for the input register (register No.: 4000 to 4563) are all primary measured data in the initial settings. By specifying the harmonic order in Harmonic Order (register No.: 0007) of the holding register, you can acquire the measured data of any order. For details of the register harmonic order, see “4.2.8 Harmonic order”.

Example: If you specify “100” for the harmonic order (register No.: 0007) for the holding register, the harmonic measurement items (register No.: 4000 to 4563) for the input register are all 100th measurement data.

3.4 CUSTOM Screen Items

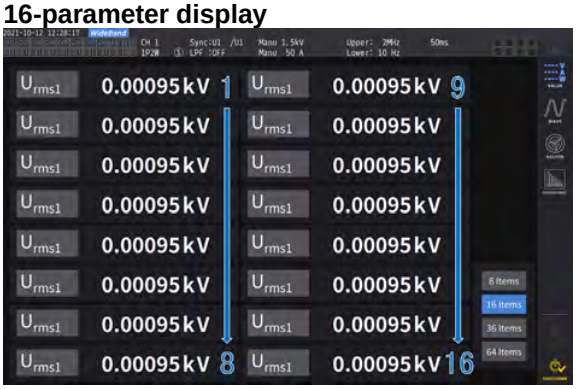
The correspondence between CUSTOM screen items of the input register (register No.: 5000 to 5247) 8ITEM1 to 8ITEM8, 16Item1 to 16Item16, 36Item1 to 36Item36, and 64Item1 to 64Item64 and the CUSTOM screen display of the instrument is as follows.

8-parameter display



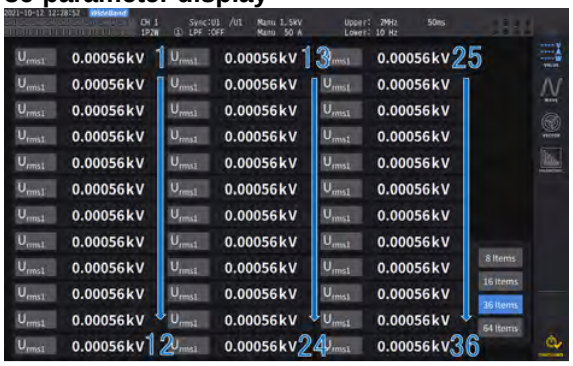
8Item1 to 8Item8 from top

16-parameter display



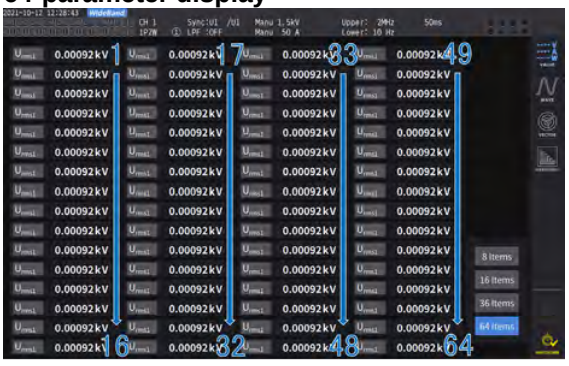
1st column from left: 16Item1 to 16Item8 from top
2nd column from left: 16Item9 to 16Item16 from top

36-parameter display



1st column from left: 36Item1 to 36Item12 from top
2nd column from left: 36Item13 to 36Item24 from top
3rd column from left: 36Item25 to 36Item36 from top

64-parameter display



1st column from left: 64Item1 to 64Item16 from top
2nd column from left: 64Item17 to 64Item32 from top
3rd column from left: 64Item33 to 64tem48 from top
4th column from left: 64Item49 to 64Item64 from top

3.5 Registering Optional Output Items

3.5.1 Registration of optional output items

For the input register optional output items (register No.: 6000 to 7999), up to 1000 optional output items can be assigned using the communications command :MODBus:ITEM. For details, see the register map under “3.1.8 Optional output items”. In the initial settings, “Pattern 1” of the preset output items is assigned to this area. For details on the preset output items, see “3.5.2 Preset output items”.

The optional output item registration is reset when the power is turned on again and “Pattern 1” of the preset output items is set every time the instrument starts up. The registration information of the optional output items cannot be saved in the settings file.

For the procedure to assign and preset output items using a communications command, see the PW8001 Communications Command Instruction Manual.

3.5.2 Preset output items

Preset output items can be specified using the communications command :MODBus:ITEM:PRESet. There is only one pattern for the preset output items that can be specified. The information of preset pattern 1 is as follows.

Pattern 1

Output No.	Output item
1	Urms1
2	Umn1
3	Uac1
4	Udc1
5	Ufnd1
6	PUpk1
7	MUpk1
8	Uthd1
9	Urf1
10	Irms1
11	Imn1
12	Iac1
13	Idc1
14	Ifnd1
15	PIpk1
16	MIpk1
17	Ithd1
18	Irf1
19	P1
20	Pfnd1
21	S1
22	Sfnd1
23	Q1

Output No.	Output item
24	Qfnd1
25	PF1
26	PFfnd1
27	Udeg1
28	Ideg1
29	DEG1
30	FU1
31	FI1
32	PIH1
33	MIH1
34	IH1
35	PWP1
36	MWP1
37	WP1
38 to 74	Urms2 to WP2
75 to 111	Urms3 to WP3
112 to 148	Urms4 to WP4
149 to 185	Urms5 to WP5
186 to 222	Urms6 to WP6
223 to 259	Urms7 to WP7
260 to 296	Urms8 to WP8
297	Urms12
298	Umn12
299	Irms12
300	Imn12
301	P12
302	Pfnd12
303	S12
304	Sfnd12
305	Q12
306	Qfnd12
307	PF12
308	PFfnd12
309	DEG12
310	PWP12
311	MWP12
312	WP12
313 to 328	Urms23 to WP23
329 to 344	Urms34 to WP34
345 to 360	Urms45 to WP45
361 to 376	Urms56to WP56
377 to 392	Urms67 to WP67

Output No.	Output item
393 to 408	Urms78 to WP78
409	Urms123
410	Umn123
411	Uunb123
412	Irms123
413	Imn123
414	Iunb123
415	P123
416	Pfnd123
417	S123
418	Sfnd123
419	Q123
420	Qfnd123
421	PF123
422	PFfnd123
423	DEG123
424	PWP123
425	MWP123
426	WP123
427 to 444	Urms234 to WP234
445 to 462	Urms345 to WP345
463 to 480	Urms456 to WP456
481 to 498	Urms567 to WP567
499 to 516	Urms678 to WP678
517 to 1000	OFF

Note: When items to which OFF is specified are read, an error value is returned.

4 Holding Register

4.1 Register Map

4.1.1 Control data

Reg No.	Ref No.	Hex No.	Register name	Register description		R/W
0000	40001	0000	Regster Hold	Register value hold/reset	uint16	R/W
0001	40002	0001	INTEG:All:Start/ Stop	All wiring integration start/stop	uint16	R/W
0002	40003	0002	INTEG:All:Reset	All wiring integration reset	uint16	W
0003	40004	0003	INTEG:Start	Each wiring integration start	uint16	R/W
0004	40005	0004	INTEG Stop	Each wiring integration stop	uint16	W
0005	40006	0005	INTEG:Reset	Each wiring integration reset	uint16	W
0006	40007	0006	HOLD	Measured value hold	uint16	R/W
0007	40008	0007	Harmonic Order	Harmonic order	uint16	R/W

For the procedure to use each register, see “4.2 Details of Control by Holding Register” in the following section.

4.2 Details of Control by Holding Register

4.2.1 Register value hold/reset

Reg No.	0000
Register name	Regster Hold
Description	Register value hold When the register value hold is executed, the input register values at that time are retained and set so that they cannot be updated even if the measured values of the instrument are updated. The values read from the input register in this state are saved as data at the time of execution of the register value hold. When the data is overwritten with 1 with the register value in the hold state, the input register is updated with the latest values at that time and retained with those values from then on. Register value reset Register value hold is reset. Along with the update of the measured values of the instrument, the input register values are updated to the latest measurement data.
Effective range	0 Reset 1 Hold Other Invalid
R/W	Read/write
Reference	・ Reading of Harmonic measurement items in the register value hold state When the harmonic order is changed with the register value in hold state, the harmonic measurement items of the input register are changed to the measurement data for the newly specified order. The data read at this time is measurement data at the time of execution of the register value hold but not the latest measurement data. When the register value hold is reset, the input register is updated with the latest measurement data. ・ Reading of CUSTOM screen items in the register value hold state When the display items of the CUSTOM screen are changed with the register value in hold state, the CUSTOM screen items of the input register are also changed in conjunction with the display items specified on the screen. The data read at this time is measurement data at the time of execution of the register value hold but not the latest measurement data. When the register value hold is reset, the input register is updated with the latest measurement data. ・ Reading of optional output items in the register value hold state When the output items using a communications command are changed with the register value in hold state, the optional output items of the input register are changed to the newly specified output items. The data read at this time is measurement data at the time of execution of the register value hold but not the latest measurement data. When the register value hold is reset, the input register is updated with the latest measurement data.

4.2.2 All wiring integration start/stop

Reg No.	0001
Register name	INTEG:All:Start/Stop
Description	All wiring integration start Starts the integration (time control) in the all wiring integration mode. If the integration control method is not all wiring integration, it is changed to the all wiring integration and the integration starts. When the integration state is RUN, 0ADJ, or OTHER, the integration start is not executed. All wiring integration stop Stops the integration (time control) of all wiring integration. If the integration control method is not all wiring integration, the integration stop is not executed. When the integration state is RESET, STOP, 0ADJ, or OTHER, the integration stop is not executed.
Effective range	0 Stop 1 Start Other Invalid
R/W	Read/write While the wiring integration is being executed, the read value of the register is 0 (stop).
Reference	The integration can be queried using the communications command :INTEGrate:STATe?. <Integration state> Integration state: RESET Integration is in reset; STOP Integration is in stop; WAIT Integration is in standby; RUN Integration is in process; OTHER States other than the above; 0ADJ Various zero adjustments are in process For details, see the PW8001 Communications Command Instruction Manual.

4.2.3 All wiring integration reset

Reg No.	0002
Register name	INTEG:All:Reset
Description	Resets the integrated data of all wiring integration. If the integration control method is not all wiring integration, the integration reset is not executed. When the integration state is WAIT, RUN, 0ADJ, or OTHER, the integration reset is not executed.
Effective range	0 Reset Other Invalid
R/W	Write only
Reference	The integration can be queried using the communications command :INTEGrate:STATe?. For details, see the PW8001 Communications Command Instruction Manual.

4.2.4 Start of each wiring integration

Reg No.	0003
Register name	INTEG:Start
Description	Starts the integration (time control) of the wiring including the specified channel. If the integration control method is not each wiring integration, it is changed to the each wiring integration and the integration starts. Each wiring integration is executed in only the channel of the target channels that can start the integration. When the integration state is RUN, 0ADJ, or OTHER, the integration start is not executed in this channel. Specification of the channel to be controlled Specifies the channel in a value from 0 to 255. Set the channel so that the bit of the target channel is 1.

128	64	32	16	8	4	2	1
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1

Effective range	0 to 255
R/W	Read/write For the read value, the bit of the channel for which integration is being executed is 1 regardless of the integration control method.
Reference	The integration can be queried using the communications command :INTEGrate:STATe?. For details, see the PW8001 Communications Command Instruction Manual.

4.2.5 Stop of each wiring integration

Reg No.	0004
Register name	INTEG:Stop
Description	Stops the integration (time control) of the wiring including the specified channel. If the integration control method is not each wiring integration, this control is not executed. The integration stop is executed in only the channel of the target channels that can stop the integration. When the integration state is RESET, STOP, 0ADJ, or OTHER, the integration stop is not executed in that channel. Specification of the channel to be controlled Specifies the channel in a value from 0 to 255. Set the channel so that the bit of the target channel is 1.

128	64	32	16	8	4	2	1
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1

Effective range	0 to 255
R/W	Write only
Reference	The integration can be queried using the communications command :INTEGrate:STATe?. For details, see the PW8001 Communications Command Instruction Manual.

4.2.6 Each wiring integration reset

Reg No.	0005
Register name	INTEG:Reset
Description	Resets the integrated data of the wiring including the specified channel. If the integration control method is not each wiring integration, this control is not executed. The integration reset is executed only in the channel of the target channels that can be reset. When the integration state is WAIT, RUN, 0ADJ, or OTHER, the integration reset is not executed in that channel. Specification of the channel to be controlled Specifies the channel in a value from 0 to 255. Set the channel so that the bit of the target channel is 1.

128	64	32	16	8	4	2	1
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1

Effective range	0 to 255
R/W	Write only
Reference	The integration can be queried using the communications command :INTEGrate:STATe?. For details, see the PW8001 Communications Command Instruction Manual.

4.2.7 Measured value hold

Reg No.	0006	
Register name	HOLD	
Description	Sets hold state.	
Effective range	0	Hold OFF
	1	Hold ON
	2	Peak hold ON
	Other	Invalid
R/W	Read/write	
Reference		

4.2.8 Harmonic order

Reg No.	0007
Register name	Harmonic Order
Description	Specifies the order for the harmonic measurement items of the input register. The initial value is “1”.
Effective range	0 to 500
R/W	Read/write
Reference	For details, see “3.3 Harmonic Measurement Items”.

5 Troubleshooting

Problem	Cause	Solution/Reference
No communications.	The cable is not connected properly. The cable in use is an item other than specified.	Refer to “9 Connecting the Instrument to a PC” in the PW8001 Instruction Manual.
	Power supply to some of the devices in connection is not turned ON.	Turn ON all the devices.
	The communication setting of the Modbus/TCP client instrument is not identical to the one for the instrument. The IP address setting is identical to the one for another device.	Refer to “9 Connecting the Instrument to a PC” in the PW8001 Instruction Manual.
	The TCP/IP port number is incorrect.	Set the port number to 502.
Communications are not working properly.	Function codes not supported by the instrument are used.	See “1.2 Function Code”.
	The ID (server address) is not correct.	Sets the unit ID (server address) to “1”.
The response message is not the same as what is displayed on the instrument panel.	It is not an error. A response message is created when the instrument receives a message. The message may not be identical to the display when it is loaded by the computer.
